Profile

Backend-focused MEng Computer Science student at the University of Strathclyde, building well-tested **Java 21** and **Spring Boot** services using **TDD**. Developed a Kafka- and Redis-based fraud detection engine, load-tested to 480 requests per second at 25ms p95. Placed **2nd at StrathHack 2026**. Uses AI tools for planning and debugging, verifying changes through tests. Seeking a 2027–28 software engineering placement.

Technical Skills

Languages: Java 21, Python, SQL, TypeScript, C

Core CS: Data Structures and Algorithms, Concurrency, Operating Systems

Frameworks and Architecture: Spring Boot, Jooby, React, RESTful APIs, JWT, Event-Driven Architecture

Data and Cloud: PostgreSQL, MySQL, Apache Kafka, Redis, AWS (Cloud Practitioner Essentials course: In Progress)

Tools and Testing: JUnit 5, Mockito, TDD, Git, Docker, Maven, GitHub Actions, AI-Assisted Development (Claude)

Education

University of Strathclyde **Glasgow**

MEng Computer Science (Integrated 5-Year, Penultimate Year Student) *2023 – June 2029*

Predicted First Class Honours (Current Average: 74%)

Expected Graduation: June 2029 (with placement year) | Available for 2027–28 industrial placements

– Implemented a Unix-style command-line shell in C, exploring process execution and memory constraints.

Hackathon Experience

StrathHack 2026, 2nd Place (ScottishPower Challenge) **Live Demo**

Zero Hour – Cyber Defence Team Game *Oct 2026*

– Collaborated in a five-person team to deliver an interactive cyber defence game, securing 2nd place in the ScottishPower challenge.

– Used AI-assisted development to implement game logic for score calculation and data parsing, and contributed to API integration.

– Used AI tools to support backend testing and debugging, helping validate game functionality during the hackathon.

Projects

Personal Project, In Progress **View Source Code**

VaultGuard – Real-Time Fraud Detection Engine *2026*

– Building a Spring Boot engine that scores transactions using risk rules for impossible travel and unusually high amounts, surfacing flagged activity to analysts.

– Designed an asynchronous Kafka pipeline with Redis for fast lookups and idempotency; accounted for at-least-once delivery to prevent duplicate risk records, with JWT authentication and rate limiting on the API.

– Developing JUnit 5 and Mockito unit and integration tests to validate risk rules and anomaly detection.

– Load-tested locally with Locust (250 concurrent users): 480 RPS, zero failures, sub-15ms median and 25ms p95, following HikariCP/Redis pool tuning and Java 21 Virtual Thread adoption.

University Team Project, in collaboration with JPMorgan Chase **View Source Code**

ScotBank – Banking System *2025*

– Created a banking system in **Java 21** (Jooby) as part of a university team, working on backend account logic and frontend integration.

– Wrote JUnit 5 and Mockito unit and integration tests in a **TDD** workflow, reaching 79% coverage across application services.

University Team Project **View Source Code**

Distributed Chat System (Discord-inspired) *2025*

– Extended a team project into a distributed chat system with Kafka cross-server messaging and shared state in Redis.

– Engineered a multithreaded server core using `ExecutorService` and a `BlockingQueue` dispatcher, with BCrypt/PostgreSQL authentication.

– Set up GitHub Actions CI with service containers, maintaining test coverage across authentication and messaging.
